Solli

Just say it. We'll fill the form.

A multilingual voice form-filler | Great Indian AI Internship Challenge | Solo project by Dhanushkumar G

The problem

Many people lose pensions and welfare benefits not because they are ineligible, but because the paperwork is out of reach. Forms are long and formal, often in a language the person does not speak at home. Many applicants are elderly, have weak eyesight, or have never typed on a keyboard, so they depend on middlemen who charge fees and sometimes make mistakes on the form.

The solution

Solli turns form filling into a spoken conversation. The applicant picks a language, Solli asks each question aloud, and the person answers by speaking, including mixed speech such as Tamil-English. Solli turns the speech into clean field values, reads important values back so mistakes are caught, and shows a review screen. The completed form can be exported as a PDF. No typing is needed.

How it works

1. **Choose a language.** Screen text and the spoken voice switch together.
2. **Solli asks.** Each question is spoken aloud in a natural voice.
3. **The person answers** by speaking, in their own words or mixed speech.
4. **Solli confirms.** Names, dates and long numbers are read back in small groups; the person says yes or no, or taps.
5. **Voice control.** Commands such as "repeat", "go back", "I don't know" and "change the village".
6. **Review and export.** A final screen lists every field; any field can be changed; the form exports as a PDF.

Who it is for

Customers: Common Service Centres, e-Sevai kendras, panchayat and ward helpdesks and NGOs that help people apply every day. **End users:** elderly and first-time applicants who can speak a language but cannot easily read or type formal forms. **Operators:** staff who adjust text size and contrast, mute the voice, and correct a field when needed.

Built on Gnani AI

Model	Role in Solli	Status
Prisma v2.5	Speech to text: understands the applicant's spoken answers	Used in the demo
Timbre v3.0	Text to speech: speaks questions and read-backs in the chosen language	Used in the demo
Evon v3.3	Reasoning LLM for answer extraction	Integration prepared, planned. The demo uses a rule-based extraction engine.

The Gnani API key stays on the server and is never exposed to the browser.

Languages

Tested by voice: English, Tamil and Tanglish. **Preview:** other Indian languages are available for screen text and voice. Development is in progress and testing in more languages is not yet complete, so accuracy in preview languages may vary.

Trust and privacy

- Nothing is stored: answers live only in memory and are wiped after inactivity or when the session ends.
- Silence or unclear speech is never treated as "yes"; unresolved fields are flagged for operator help.
- Sensitive values are masked on screen. Validation checks format only; Solli does not verify Aadhaar, phone or bank details.

Honest limits

Solli is an independent student prototype. It is not a government service, does not submit forms to any portal, and all demos and tests use fake data. Voice accuracy has not yet been formally measured across languages.

Planned next (not built yet)

A browser extension that scans the fields of any web form and lets the applicant fill them by voice, with a match check between the confirmed value and the value on the page. It would never submit automatically. Also planned: properly tested support for more languages and more forms.
